Query types

Query by variant

Query for a specific variant

Query by genomic region

Discovery mode. Query based on annotation of genomic regions: a set of nucleotide positions, defined genomic regions including untranslated, intergenic and ORFs, a custom region, or the full-length sequence can be selected as search pool

Query by functional domain

Discovery mode. Query based on annotation of functional domains: defined annotated functional domains including surface motifs, hypervariable regions, receptor binding sites and RNA modification sites can be selected as search pool
